

A's and B's

SEED GLOBAL HEALTH ECHO SESSION 11/11/2022

Rapid Airway and Breathing Assessment and Interventions

- ▶ Function
- ▶ Anatomy
- ▶ Rapid assessment of airway
- ▶ Rapid assessment of breathing
- ▶ Airway interventions and equipment
- ▶ Breathing interventions and equipment
- ▶ Specific conditions

Function

- ▶ Exchanging external air with gases in the blood stream
- ▶ Oxygenation – bringing O₂ into the system
- ▶ Ventilation – taking CO₂ out of the system

Anatomy

Upper respiratory tract

Nasal cavity

Pharynx

Larynx

Lower respiratory tract

Trachea

Primary bronchi

Lungs

Upper respiratory tract

- ▶ Conducts air down to lungs
- ▶ Nose/Sinuses
- ▶ Mouth
- ▶ Pharynx
- ▶ Larynx
- ▶ Epiglottis
- ▶ Trachea

Lower Respiratory Tract

- ▶ Conducts air and then participates in gas exchange
- ▶ Trachea
- ▶ Main bronchus
- ▶ Right and left bronchi
- ▶ Lung lobes with bronchi, bronchioles and alveoli

Other important systems involved

- ▶ Brainstem – stimulation for inspiration and expiration
- ▶ Spinal cord and vagal and phrenic nerves
- ▶ Diaphragm
- ▶ Chest wall and intercostal muscles
- ▶ Cardiovascular system

Anatomy

- ▶ Any of these sites can get trauma, infection, swelling, tumors, foreign body or other diseases
- ▶ This blocks or alters air conduction and gaseous exchange

Assessment of Airway and Breathing

Assessment of Airway

- ▶ Look at the patient. Do they appear to be choking?
- ▶ Start by speaking with the patient. Simple to ask their name
- ▶ Listen to the quality of their voice. Does it sound muffled?
- ▶ Listen to air movement through their upper airways. Do they have stridor? Do they have gurgling?
- ▶ Visually inspect. Do they have obvious swelling? Do they have obvious foreign body? Do they have blood or other secretions? Is there any trauma?

Assessment of Breathing

- ▶ Visually inspect work of breathing
 - Are they using accessory muscles? Intercostals, sternocleidomastoid, or abdominal breathing, tracheal tugging, nasal flaring, head bobbing
 - Do they have shallow or inadequate respirations?
 - Respiratory rate
 - Are they tiring or slowing?
- ▶ Visual inspection
 - Look for tracheal deviation, distended neck veins, chest trauma, unequal chest expansion

Assessment of Breathing

▶ Pulse Oximetry

- Many limitations but essential to obtain

▶ Listen

- Auscultate breath sounds bilaterally
- Are there breath sounds bilaterally? Equal?
- Listen to all lung fields for crackles, wheezes

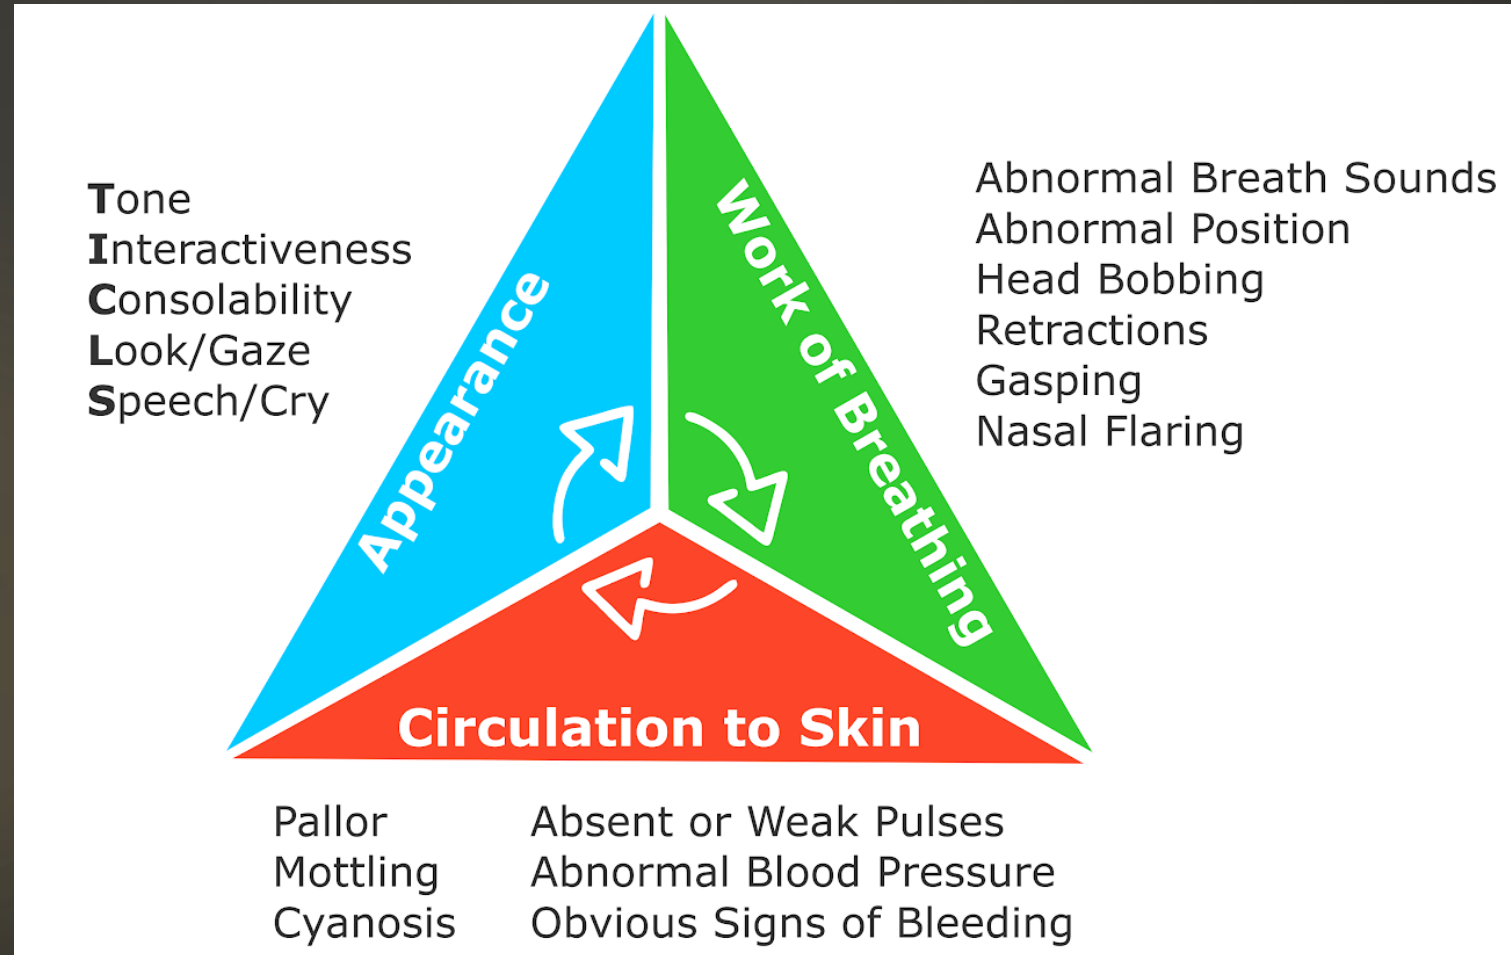

▶ Touch

- Palpate chest wall, percussion of lung fields

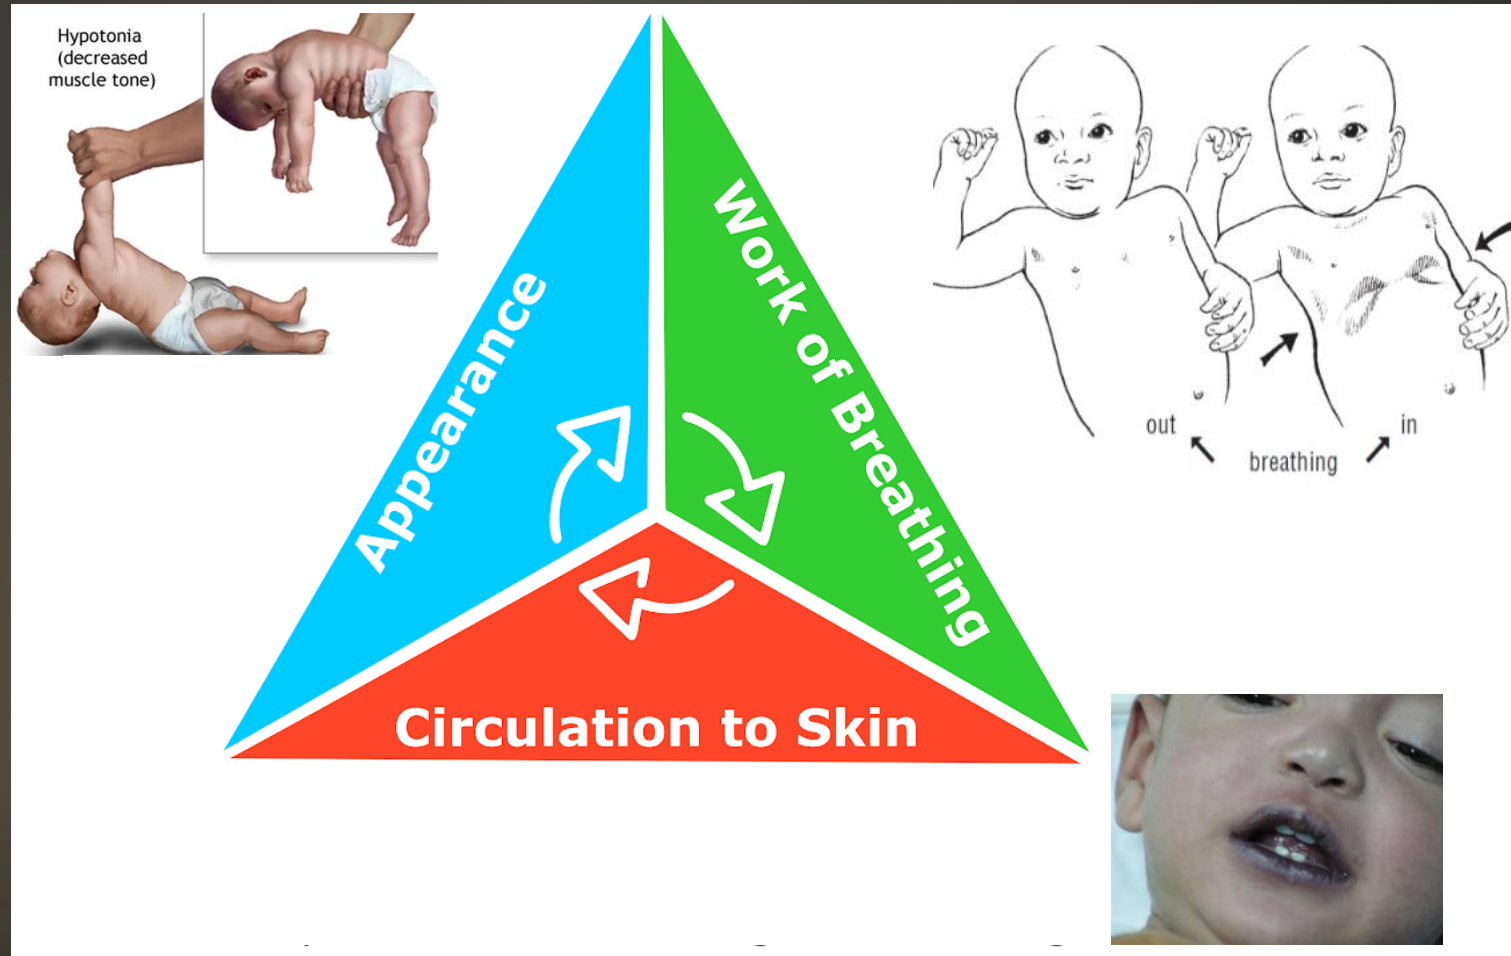

Assessment of Breathing

- ▶ Other systems/Other causes of respiratory failure
 - Listen to heart sounds – are they muffled, tachycardic, irregular etc
 - Check blood pressure and heart rate – looking for shock, arrhythmia etc
 - Check neurologic status – do they have altered mental status, is this affecting their breathing
 - Expose - look for cyanosis, diaphoresis, trauma, limb swelling, pulses in all extremities

Pediatric Assessment Triangle

Pediatric Assessment Triangle

General Pediatric Anatomical Differences:

- ▶ Large head compared to body size
- ▶ Large tongue compared to mouth
- ▶ Smaller airway
- ▶ More anterior airway

Pediatric Respiratory Rates

Age	Breaths per minute
Infant	30-50
1-3 years	20-40
3-5 years	20-30
5-12 years	15-25
> 12 years	12-20

Unique Features of the Pediatric Respiratory Tract

Feature	Consequence
<u>Nose</u> : infants <4 mo preferential nose breathers	Nasal congestion → respiratory distress
<u>Larynx</u> : higher, softer, more elastic	Intubation considerations, easily collapsible
<u>Trachea</u> : shorter and $\frac{1}{3}$ diameter of adult at birth	ETT easy to dislodge, narrower → increased resistance
<u>Alveoli</u> : elastic fibers less developed	Alveoli more collapsible → ventilation/perfusion (VQ) mismatch
<u>Lungs</u> : smaller capacity	Smaller reserve
<u>Chest wall</u> : more compliant, immature muscles	More severe retractions, more easily fatigued

Differential Diagnosis Map

Interventions

Airway Interventions

- ▶ Choking interventions
 - Abdominal thrusts
 - Back slaps

CONSCIOUS CHOKING

Cannot Cough, Speak, Cry or Breathe

After checking the scene for safety and the injured or ill person, have someone **CALL 9-1-1** and get consent. For children and infants, get consent from the parent or guardian, if present.

1 GIVE 5 BACK BLOWS

■ Adult:

■ Child:

■ Infant:

2

GIVE 5 ABDOMINAL THRUSTS

■ Adult:

■ Child:

■ Infant: (chest thrusts for infant)

TIP: For infants, support the head and neck securely. Keep the head lower than the chest.

3

REPEAT STEPS 1 AND 2 UNTIL THE:

- Object is forced out.
- Person can cough forcefully or breathe.
- Person becomes unconscious.

Airway Intervention

- ▶ Foreign body removal
 - Only if object can be visualized
 - If it is past pharynx expert help will be needed

Airway Intervention

- ▶ Airway Positioning
 - Sit patient upright
 - Head tilt/chin lift
 - Jaw thrust

Pediatric Positioning Considerations

- ▶ Shoulder or neck roll to improve airway alignment
- ▶ “Sniffing position”

Airway Intervention

▶ Suctioning

- Oropharyngeal
- Nasopharyngeal

Airway Intervention

- ▶ Oropharyngeal Airway
 - Useful for keeping posterior pharynx open
 - Correct sizing important

Airway Intervention

▶ Oropharyngeal airway insertion

Airway Intervention

- ▶ Nasopharyngeal airway
 - Also useful for opening posterior pharynx, especially if conscious patient or clenching jaw
 - Use lubrication

Airway Interventions

▶ Extraglottic Devices

- Sit outside of the glottis
- Provide direct air flow into the lower airways
- Protect the airway minimally, not definitive
- **Used as a bridge to intubation**
- Improve oxygenation and ventilation
- For use in cardiac arrest
- Include laryngeal mask airways, king airways

Airway Interventions – LMA

Airway intervention

▶ King Airway

Airway Intervention

- ▶ Adrenaline 0.3mg intramuscular if signs of anaphylaxis
- ▶ Steroids for allergy or infection swelling
- ▶ Antihistamines
- ▶ Other medications or surgical interventions depending on the condition

Airway Intervention

- ▶ Airway protection if signs of rapidly progressing swelling or inability to protect
- ▶ Endotracheal intubation definitive

Airway Intervention

Endotracheal Intubation

- ▶ Indications

- ▶ Definitive airway needed because

- ▶ Aspiration risk due to inability to protect airway
 - ▶ Risk of obstruction from swelling, infection etc

- ▶ Breathing indications

- ▶ Need for positive pressure ventilation because of failure in oxygenation or ventilation

Airway Intervention

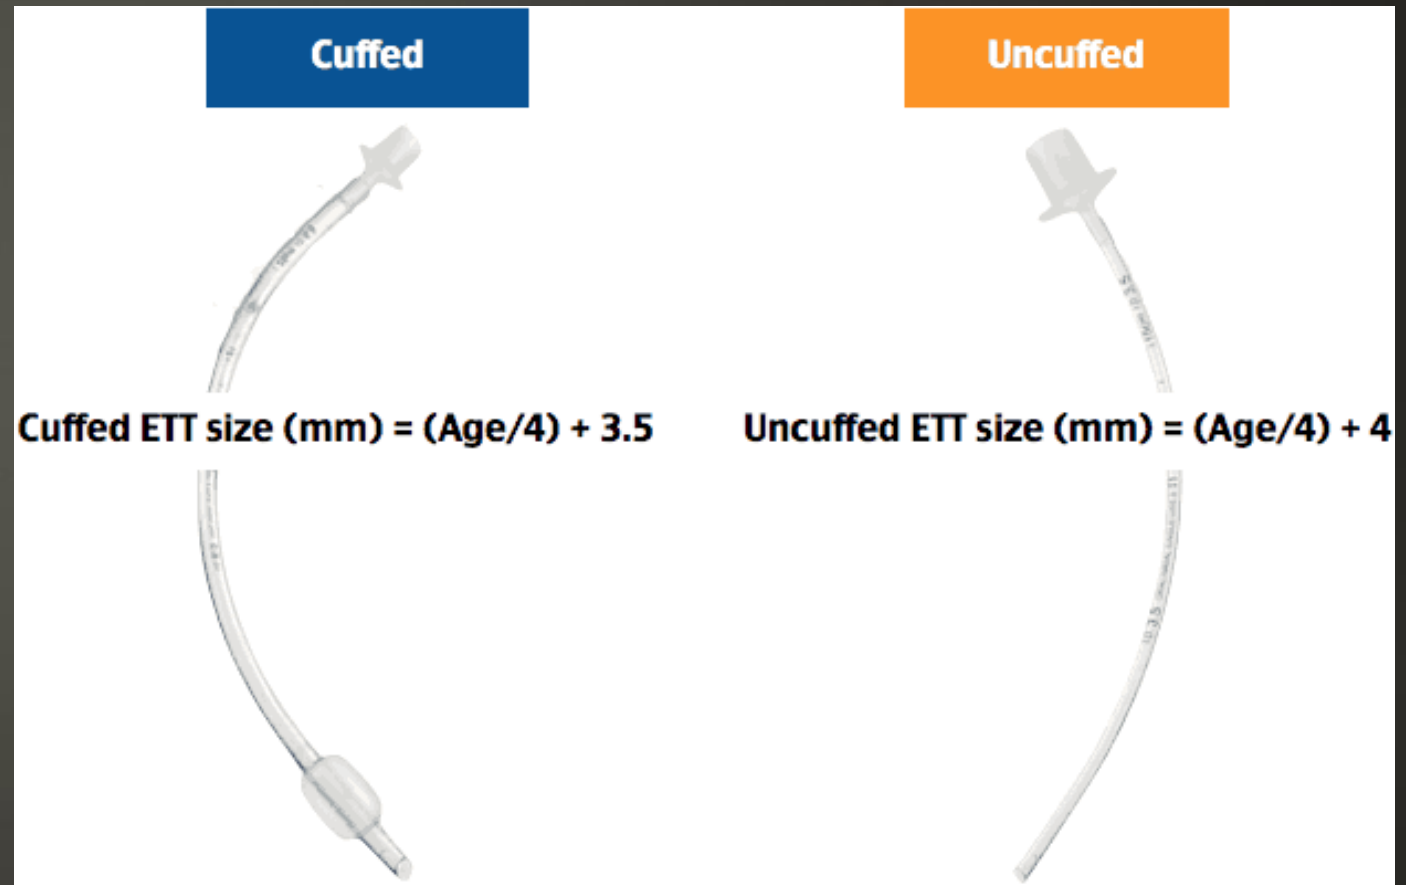

Endotracheal Intubation

- ▶ Disadvantages
 - ▶ Technically difficult
 - ▶ Stimulates the pharynx
 - ▶ Requires high level of resources
 - ▶ Requires patient to be sedated and paralyzed

Pediatric Endotracheal Intubation:

- ▶ Laryngoscope Selection:
- ▶ Straight blade (Miller) for younger or smaller patients (newborns, infants, generally under 2 years old)
- ▶ Curved blade (Mac) for larger, older patients

Airway Intervention

▶ Cricothyrotomy

▶ Can't intubate, can't ventilate scenario

Airway Intervention: Pediatric Needle Cricothyrotomy

- ▶ Pediatric Needle Cricothyrotomy:
 - ▶ Indications: surgical airway of choice for children <12 (smaller airway, risk of injury)
- ▶ Use 14 gauge IV catheter
- ▶ Percutaneous Transtracheal Jet Ventilation
 - ▶ Ventilation system that can provide oxygen through a small diameter
 - ▶ Manual triggering of oxygen flow

Breathing interventions

- ▶ Oxygen
- ▶ Goal SPO2 92-99% (88-92% for COPD patients)
 - ▶ Avoid too much oxygen
 - ▶ Add oxygen if oxygenation < goal

Breathing interventions

- ▶ Oxygenation
 - ▶ Nasal cannula
 - ▶ 2-6 liters per minute
 - ▶ 24-40% fiO_2

Breathing Interventions

- ▶ Oxygenation
 - ▶ Simple mask
 - ▶ Flow 5-10 liters/min
 - ▶ 30-60 $\text{fiO}_2\%$

Breathing Interventions

- ▶ Oxygenation
 - ▶ Non-rebreather mask
 - ▶ Flow 10-15 liters/min
 - ▶ 85-95 $\text{fiO}_2\%$

Breathing Interventions

- ▶ Oxygenation
 - ▶ High flow nasal cannula
 - ▶ Flow 10-60 liters/min
 - ▶ Up to 100 fiO₂%
 - ▶ Some pressure delivered

Breathing Interventions

Non-invasive positive pressure ventilation

- ▶ Bilevel (Bipap) or Continuous (CPAP) Positive Airway Pressure

Pediatric Bubble CPAP

- ▶ Breathing circuit that delivers humidified oxygen
- ▶ Expiratory circuit portion immersed in water to create PEEP
- ▶ Can be used with wall oxygen or concentrator
- ▶ Used in infants

Fig. 17. Bubble CPAP with inexpensive modified nasal prongs can be run with an oxygen concentrator

start oxygen flow at 5 L/min, look for bubbles in water bottle, increase up to 10 L/min if needed to generate bubbles

Breathing Interventions

- ▶ Bag Valve Mask
 - ▶ For temporary use in apnea or inadequate respirations
 - ▶ Bridge to intubation
 - ▶ Assists with oxygenation and ventilation
 - ▶ Does not secure the airway

Breathing Interventions

- ▶ Bag Valve Mask
 - ▶ Use OPA or NPA
 - ▶ One hand technique – C E method

Breathing Interventions

- ▶ Bag Valve Mask
 - ▶ Two hand technique

Breathing interventions

- ▶ Intubation

- ▶ As noted above – if definitive airway needed or failure of oxygenation or ventilation

Breathing interventions

▶ Treat the underlying condition!

- Pneumonia – antibiotics
- Asthma/COPD – steroids, bronchodilators
- Pulmonary Embolism – blood thinners
- Heart failure – nitroglycerin, diuresis, inotropes
- Pneumothorax – chest tube
- Pleural effusion – thoracentesis
- Tense ascites – paracentesis
- Tamponade – pericardiocentesis
- Opiate overdose - naloxone

Specific Threatened Airway Conditions

Angioedema

- ▶ Rapid swelling of face, lips, tongue, epiglottis
- ▶ Can be hereditary, allergy mediated, or a non-allergic reaction to medication (ACE inhibitors)
- ▶ Often becomes an airway emergency if it involves tongue or pharynx
- ▶ Treat as anaphylactic if there is any suspicion that it may be allergic

Ludwigs Angina

- ▶ Infection of the space underneath the tongue and mandible
- ▶ Can rapidly swell and block the airway
- ▶ Needs stat surgical drainage, antibiotics
- ▶ Airway may need early intervention with intubation

Croup

- ▶ Common cause of stridor in children < 3 years
- ▶ Viral infection causes inflammation and swelling of larynx
- ▶ Barking cough may be present
- ▶ Rarely causes complete obstruction
- ▶ Steroids and cool humidified air are first line treatment
- ▶ Nebulized adrenaline in moderate to severe cases
- ▶ Must be sure it is not epiglottitis or foreign body

Epiglottitis

- ▶ Infectious inflammation and swelling of the epiglottitis
- ▶ Airway can rapidly become obstructed
- ▶ Three D's – drooling, dysphagia, distress
- ▶ Stridor and a muffled voice are often present

Epiglottitis

- ▶ Have suspicion in unvaccinated patients with stridor
- ▶ Most often caused by strep, staph, H. flu
- ▶ Treat with emergency ENT consult, antibiotics, steroids, nebulized adrenaline and airway control
- ▶ If ENT unavailable and failure of oxygenation or ventilation will need endotracheal intubation with planning for possible cricothyrotomy

Foreign Body

- ▶ Suspect in any pediatric patient with sudden onset stridor or difficulty breathing
- ▶ Adults will often adopt choking pose
- ▶ Use abdominal thrust/ back blows if there is no air movement
- ▶ If foreign body is visible may remove with finger sweep
- ▶ If patient is stable enough for xray it may help
- ▶ Specialist consultation (ENT, pulmonology, surgery, emergency)
